

Retrospective Notes:

Looking Back on Version 1:

We had initial problems with communication, but we realized and corrected ourselves by meeting up. We started the project with all of us working on the overall problem, but when we met up we decided a better strategy was to split up the work and have each person work on different parts.

Looking Forward onto Version 2:

Upgrade User Interface

Create a mobile look, that is as simple as possible

Possibly have a loading bar

More animations like click filter logo, have page be more interactive

Good that we already have the hover filter

We can change from clicking to dragging

Further Implementations

Creating a slider/pentagon view where we can view all filtered images at once

Possibly creating more filters

Webcam/Image Processing

To be done in realtime

Graphically, done as another section on current webpage; not creating another page

Technologies

What framework/programs should we use

Currently using react

JQuery may be better for future

Especially if we are adding a lot on top of our current model, trying to keep the design simple

Look into using Bootstrap in the future as well

Helps user experience

Is good for desktop to mobile transition
